Education

University of the Punjab 2022 – 2026
Bachelor of Science in Computer Science

Experience

Associate Software Engineer (AI/ML) Mar 2026 – Present
The Dev Corporate (TDC) *Lahore, Pakistan*

- Co-develop the AI layer of a cloud-based dental practice management platform for US healthcare providers, working with product and client-facing teams to turn clinical and front-office workflows into production LLM and computer vision features, and to explain model trade-offs such as accuracy, latency, and data privacy.
- Built an AI clinical-notes feature that transcribes appointment audio with speech-to-text and uses an LLM to draft structured SOAP-style notes grounded in the patient's history and treatment plan, paired with hands-free voice charting that converts spoken findings into structured chart entries and saves them to the patient record automatically.
- Developed a conversational analytics assistant that lets staff ask questions about their practice in plain English; an LLM translates each question into a validated data query and returns an interactive report or dashboard, replacing manual report building.
- Integrated AI-assisted X-ray analysis that runs computer vision models on dental radiographs to highlight potential findings for clinician review, and feeds those findings directly into charting and treatment planning.
- Built an LLM-powered resume-parsing service that uses prompt-based structured extraction to turn unstructured resumes into clean candidate profiles, exposed as a reusable API for an HR management platform.

AI Developer (Freelance) Freelance
AI GitHub Auditor – Independent Client Project *Remote*

- Developed an AI-assisted repository auditing tool for an independent client, using the GitHub API to collect repository data and track project metrics so code health could be monitored over time.
- Automated static analysis with Bandit, Pylint, and ESLint to surface security vulnerabilities, bugs, and code-quality issues across Python and JavaScript codebases.
- Ran the Phi-2 small language model locally to convert raw analyzer output into plain-language audit summaries with prioritized recommendations, so client code never had to be sent to third-party APIs.

Projects

eMCP Nexus (Final Year Project) | *Python, FastAPI, RAG, FAISS, Docker*

- Built a full-stack AI/MCP tool marketplace on FastAPI, allowing developers to publish, deploy, and monetize their tools through a pay-per-task execution model.
- Developed a semantic search engine using vector embeddings and a FAISS index, so users can find the right tool by describing what they need in natural language.
- Integrated a RAG-powered support chatbot that retrieves from tool documentation to answer integration and troubleshooting questions, alongside a recommendation system based on usage rankings.
- Engineered a GitHub-to-deployment pipeline that parses a repository and automatically deploys it as a containerized FastAPI endpoint.

Presence.AI | *Python, scikit-learn, OpenCV, TensorFlow*

- Built and deployed a real-time face-recognition attendance system using OpenCV and a VGG-based deep learning model, reaching roughly 92% recognition accuracy with inference running locally.
- Designed the end-to-end ML pipeline, from live frame capture and face detection to feature extraction and matching against enrolled users.
- Trained and evaluated the recognition model with TensorFlow and scikit-learn, tuning it until results were consistently reliable.

- Automated attendance logging and notifications so recognition results become attendance records and alerts, removing manual roll calls and follow-up.

LegalSense | *Python, RAG, LangChain, Vector Databases*

- Built a RAG-based legal advisory chatbot that retrieves relevant passages from legal documents using vector embeddings, so answers are grounded in source material.
- Created the ingestion pipeline: chunked legal documents, generated embeddings with an open-source Hugging Face model, and stored them in a vector database for semantic search.
- Used LangChain to orchestrate retrieval and generation, passing the top-ranked passages as context to a locally run LLM for each question.
- Designed prompts that restrict the model to the retrieved text, reducing hallucinated answers and making legal information easier for non-experts to follow.

Skills

Programming: Python, JavaScript, C++
LLMs & Generative AI: LLM Integration, AI Agents, Local & Open-Source LLMs (Phi-2), Prompt Engineering, Structured Data Extraction, Text-to-Query, Speech-to-Text, Text Categorization, NLP
RAG & Vector Search: RAG Pipelines, LangChain, FAISS, Pinecone, ChromaDB, Embeddings, Document Chunking, Semantic Search
ML & Computer Vision: scikit-learn, TensorFlow, Hugging Face, OpenCV, VGG, Medical Image Analysis, Face Recognition, Model Training & Evaluation
Backend & APIs: Django, FastAPI, RESTful APIs, GitHub API, API Integration, Workflow Automation, Event-Driven Automation
Deployment & Tools: Docker, Git, CI/CD, Model Deployment, Static Code Analysis (Bandit, Pylint, ESLint)
